Feeding of EM (Effectice microorgnisms) to sheep:

Effects on haematological, clinical and
parasitological parameters

10 Jahre
Bio Institut
raumberg-gumpenstein.at/bio-institut

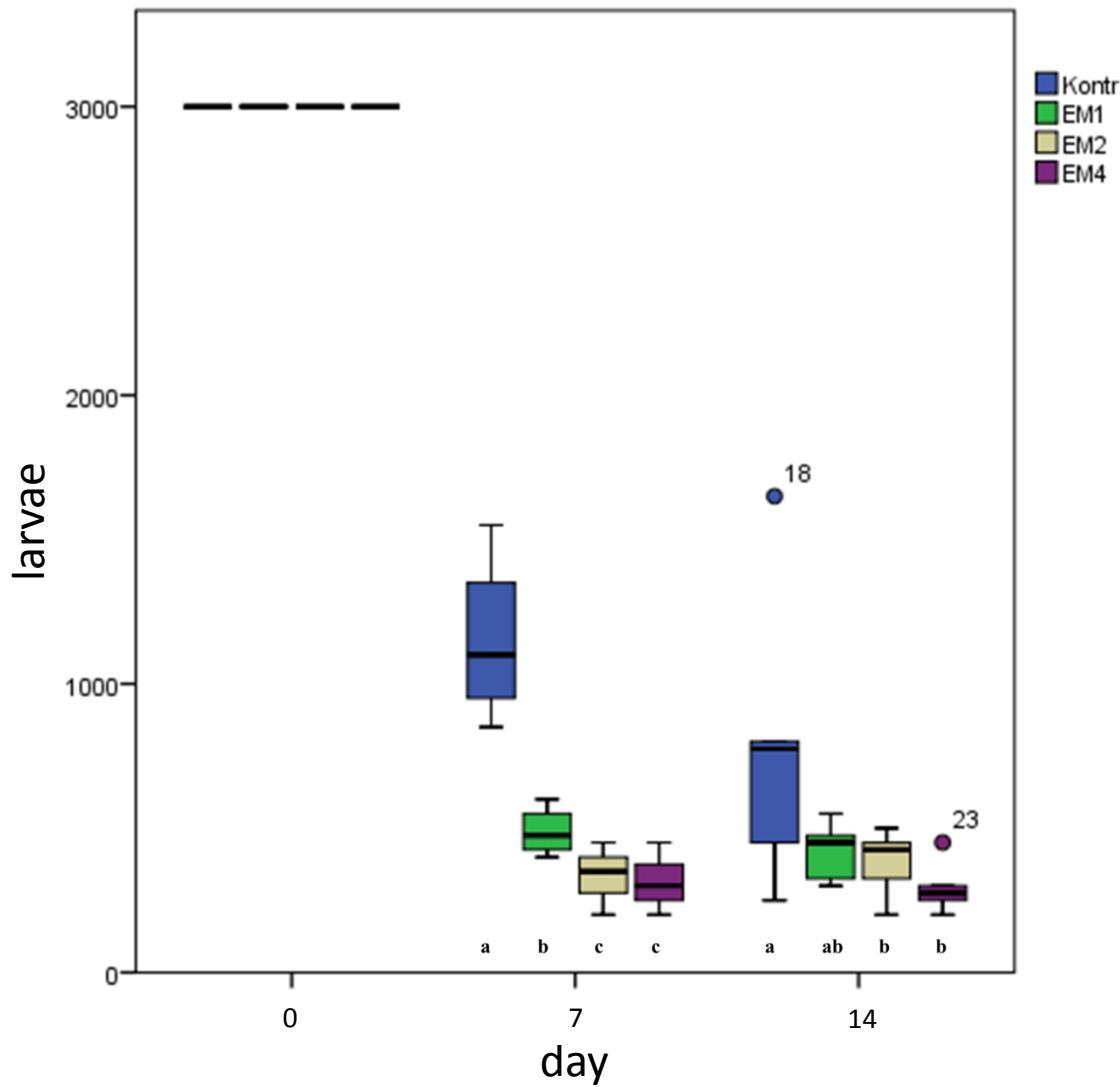

Parasite management – organic farming

- Anthelmintics
 - Double withdraw time, resistancies
- Pasture management
 - Difficult austrian conditions
- Plants/forages which contain condensed tanins (polyphenolic compounds)
 - Until now no practical recipies
- Biological control:
 - Duddingtonia flagrans: nematode trapping fungus
 - Until now no european authorization for additional feeding

Effective microorganisms

- Mixture of bacteria, yeasts, fungi, etc.
- Mainly lactic acid producing bacteria
- Often used in composting, horticulture, private gardening, etc,
- Also in stables to reduce smell

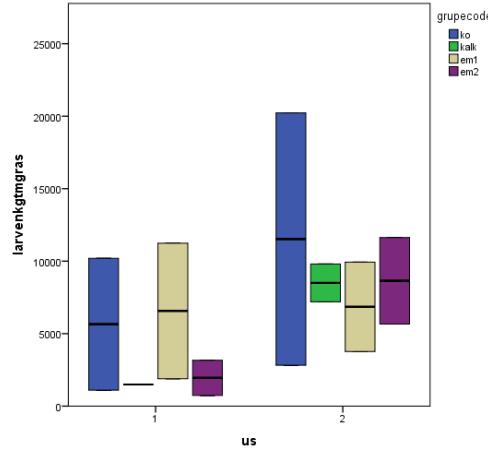

In vitro: recovery rates

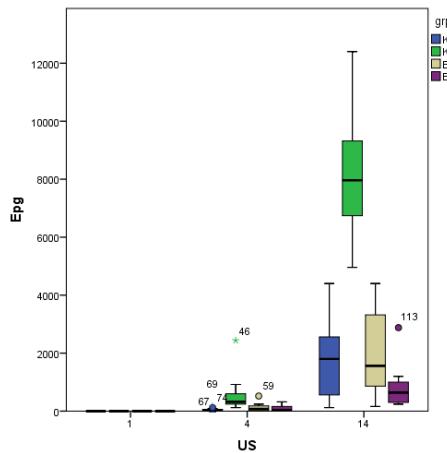

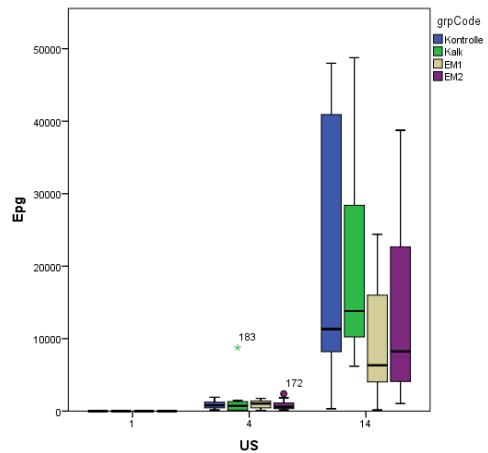

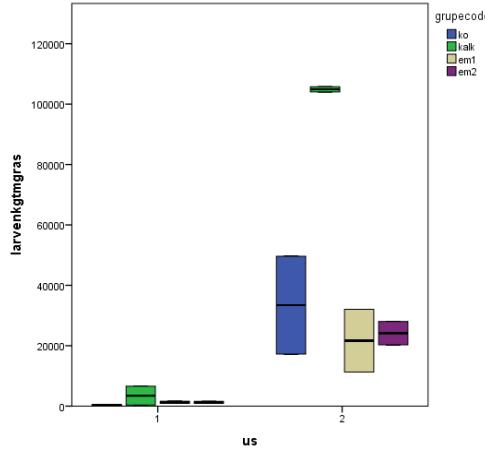

Pasture trial: Laboratory examinations

2013

2014

Material und method

	Control n=8	EM1 n=8	EM2 n=8
Week 1+2	2 x daily 10 ml H ₂ O	2 x daily 1,25 ml EMa + 8,75 ml H ₂ O	2 x daily 2,5 ml EMa + 7,5 ml H ₂ O
Week 3+4	2 x daily 10 ml H ₂ O	2 x daily 2,5 ml EMa + 7,5 ml H ₂ O	2 x daily 5 ml EMa + 5 ml H ₂ O

Material und method

	weeks
Routine clinical examination	0, 4, 8
Blood samples	0, 4, 8
Fecal samples	0, 4, 8

Approval for animal experiments :Ges-140378/18-2013 Hi

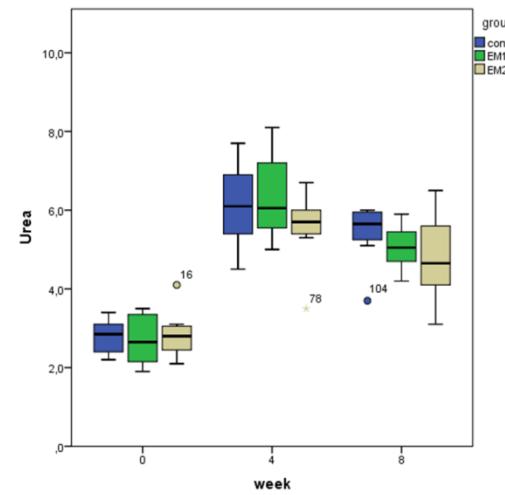

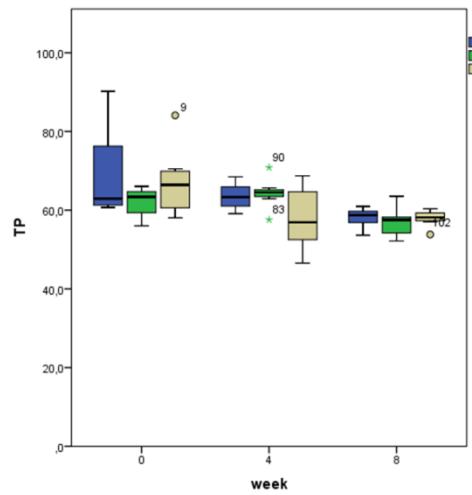

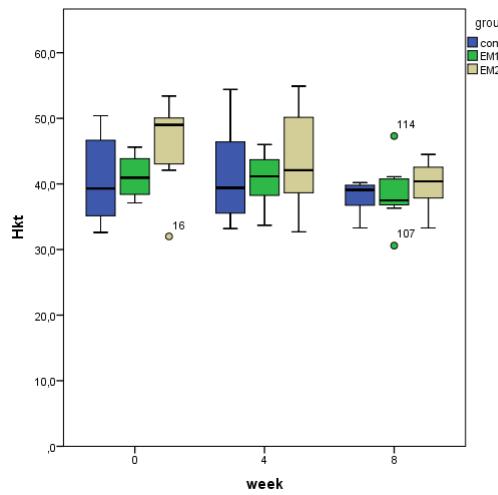

Results

Results

Results

Conclusion

- In vitro:
 - effects detectable
- Pasture trial:
 - best results reflect at best some tendencies
- Feeding trial:
 - EM can be improvidently fed to sheep
 - In the given dose and duration
 - No relevant effect in parasitological status

Discussion

- In vitro:
 - Effects strong enough to work in practice and how?
- Pasture trials:
 - intensity of pasture management?
- Feeding management:
 - Duration
 - Application of EM to water permanently?
 - Concentration
 - Other effects with higher concentration?
